Abstract not available for CN1328339

Abstract of correspondent: EP0717429

An image-forming apparatus comprises an electron source (1) and an image-forming member disposed in an envelope (5). The image-forming member includes a fluorescent film (7) and a metal back (8) covering the fluorescent film (7). The metal back contains a gettering substance and the gettering substance is irradiated with electron beams emitted from the electron source.
